

# **CASE STUDY 042**

## **[SQL]**

### **Hotel Supply Store Sales Analysis**

Here are some clues in case you are stuck with the case study:

1. You should download and install the latest version of PostgreSQL (EnterpriseDB distribution) / PGAdmin that is not released under beta, accordingly to your OS.  
The link is: <https://www.postgresql.org/download/>
2. To complete the installation process, you should choose the default options and unselect the option of launch the Stack Builder at the end that we are not going to use.
3. You must grant permission to Everyone to Read & Execute, List Folder Content, Read and Write to the folder where you placed the CSV files containing the content.
4. To create a database, open PGAdmin and right-click the tree view. From the list, select create > database.
5. To open a query tool, right-click the recently created database from the tree view and select a query tool
6. To create the tables, you must open the file table\_creation.sql in a text editor, copy all its content, paste into the query tool and execute.
7. To load the data into the tables, you must open the file data\_import.sql in a text editor, copy all its content, paste into the query tool, change the path to the place where you pasted the data and execute.
